 fak., 1955 (19570, 3, No 5, 1-17)
 ABSTRACT : Qualitative and quantitative dependencies between
 extracted alkaloids and balast materials was es-
 tablished. Quantity of separated substances de-
 pends on the weight-volume ratios of phases and
 on the nature and concentration of a solvent. The
 maximum yield of extracted alkaloids with a mix-
 ture of water-alcohol is attained with 40% alcohol
 content; the extracted quantity decreases some-
 what at 50-60% alcohol content. At the increased
 acidity of a solvent (pH of 4.6) quantity of the

Title: On the Entrainment of Nonvolatile Substances During Distillation of Their Aqueous Solutions

Original

Periodical: Dokl. Bulgar. AN, 1954 (1955), Vol 7, No 3, 13-16 (in German with a summary in Russian)

Abstract: The contamination of distilled water caused by boiling during distillation is investigated; 0.1, 0.5, and 1 N solutions of KCNS, KBr, K_2SO_4 , and potassium citrate were prepared, using distilled water. It was established that the various anions can be arranged in the following series in order of decreasing contamination: citrate > SO_4^{2-} > Br^- > CNS^- . It is shown that the contamination is greater the lower the distillation temperature; contamination is also a

TITLE: Manufacture and Use of Glass-reinforced Plastics

PERIODICAL: Plasticheskiye massy, 1960, No. 4, pp. 71-73

TEXT: The coordination of research and experimental studies of glass-reinforced plastics (grp) was discussed at the Extended Meeting of the Scientific and Technical Council of the NIIPM (Nauchno-issledovatel'skiy institut plasticheskikh mass, Scientific Research Institute of Plastics) held from December 24 to 26, 1959. It was attended by 117 delegates from special research institutes and 43 delegates from grp consumer organizations. M. S. Akutin reported on the use of grp at home and abroad, and on the tasks to be fulfilled in the current Seven-year-Plan. A. A. Peshekhonov discussed modern manufacturing methods of grp products and studies made at the NIIPM and NIISV. P. Z. Li reported on the properties of glass textolite on the basis of the phenol-resol resin and polyvinyl butyral. T. M. Lukovenko explained the properties of glass textolite on the basis of epoxy-phenol resins as well as an attempt to produce glass-

Card 1/4

Manufacture and Use of Glass-reinforced
Plastics

B016/B058

textolite on the basis of chemically protected glass fabrics. Z. V. Mikhaylova reported on the manufacture of unsaturated polyester resins, which are solidified in a cold state. The types ПН-1 (PN-1) and ПН-2 (PN-2) have gone in mass production. Ye. L. Kaganova reported on the manufacture of equal resins by using diphenic acid and on the manufacture of polyester-styrene resins on the basis of diethylene glycol, ethylene glycol, maleic anhydride, and diphenic acid. Diphenic acid as a substitute for phthalic anhydride will enable the use of the abundant resources of phenantrene. L. N. Sedov reported on the contact method of forming large-size products from grp on the basis of binding agents of the types ПН-1, ПН-2, and ПН-4 (PN-1, -2, and -4), as well as on grp of increased water resistance and reduced combustibility. V. A. Eksanov discussed the same forming method from glass-reinforced polyester plastics. Ye. M. Demekhina discussed the production process of glass textolite on the basis of polystyrene. K. N. Vlasova reported on the manufacture of grp on the basis of polyamide resins and on a new binding agent, graft polymer formed by interaction of the resins mentioned with epoxy resins. V. N. Kotrelev discussed the manufacture of grp on the basis of polycarbonates. V. M. Gel'perina dealt with grp on the basis of organosilicon compounds. I. M. Gurman

Card 2/4

Manufacture and Use of Glass-reinforced
Plastics

B016/B058

reported on a new binding agent, the epoxy dimethyl resorcinol resin. It was obtained through combination of the epoxy resins ЭД-5 (ED-5) and ЭД-6 (ED-6) with novolak resins. N. V. Kulikov reported on attempts to produce tubes from grp. N. N. Senatskiy reported on the manufacture of grp products by using preformed workpieces (semifinished products). O. M. Levitskaya spoke about the introduction of the production of unsaturated polyester resins PN-1, PN-2, and PN-125 in vacuo. V. G. Danilova reported on the production of the resin PN-1, started at the Rubezhanskiy khimkombinat (Rubezhnoye Chemical Combine). A. A. Pavlyukov reported on the state of organization in the field of grp products. Machines for the manufacture of large construction glass mats were developed at the Opytno-konstruktsionnoye byuro, Luganskiy sovnarkhoz (Experimental and Design Office at the Luganskoye Council of the National Economy). A. M. Kogan reported on the manufacture of miner's trucks and similar objects from grp. In his lecture on glass fillers, M. G. Chernyak pointed out that their composition influences the properties of grp. An alumino-boron silicate filler is being developed. About 60 types of machines were developed for the continuous manufacture of glass fibers. I. I. Ioffe reported on grp of high strength on the basis of orientated glass fibers. E. E. Kol'man-Ivanov in his

Card 3/4

Manufacture and Use of Glass-reinforced
Plastics

S/191/60/000/004/015/015
B016/B058

lecture described foreign machines for the manufacture of grp and pointed out that specialized machines are to be manufactured at home in the course of the present Seven-year Plan. V. V. Audring discussed the main trends of experimental studies in the field of home-made machinery for the manufacture of grp products. Ya. D. Avrasin reported on studies dealing with the manufacture of heat-resistant grp. The delegates of the research institutes finally exchanged their experience in the field under discussion. K. S. Zatsepin reported on the replacement of steel tubes by grp tubes and on other problems connected with the manufacture of grp tubes. L. M. Pesin underlined the ever-increasing importance of urea-formaldehyde resins as binding agents. I. K. Luk'yanchikov reported on the prospects of applying grp in railroad construction. O. V. Tamruchi reported on comprehensive research work concerning the manufacture of friction and antifriction materials from grp. I. F. Kanavets underlined the great importance of test methods permitting to determine the dependence of grp strength on the content of fillers and binding agents. The Scientific Council of the NIIPM proposed further measures concerning the extension of the raw-material assortment for grp. ✓

FRANK REELON, D

- V The catalytic decomposition of hydrogen peroxide, D.

Trandafelov, *Annales chim. Phys.* 48, 105, 1953 (German summary). -- *Math., Liège* 3, Pt. 1, 86-90 (1953, 54) (German summary). -- *SH*

The rate of catalytic decomposition of H_2O_2 (I) by $Fe_2(SO_4)_3$ (II) in the presence of cupric and H^+ ions depends upon the concentration of colloidal $Fe(OH)_3$. Hydrolysis of II either by long storage or by heating 3 hrs. at 60° increases its catalytic effect. However, when II was heated at 90° , an irreversible coagulation took place and the catalytic effect decreased; prevention of coagulation by addition of H_2SO_4 increased the catalytic effect. The "ferrisulfate modulus", SO_4/Fe_2O_3 , and not the concn. of either H^+ or ferric ions, detrs. the rate of decomposition. Cupric ions catalyze the decomposition of I when adsorbed on colloidal $Fe(OH)_3$; once the sol is satd. with cupric ions further addition does not increase the rate.

Title : The Mechanism of Oxidation-Reduction Reactions.
The Detection of Small Quantities of Selenium
and Tellurium in the Presence of Arsenic

Orig Pub : Farmaica (RPR) 1959, 7, No 2, 135-141

Abstract : On the basis of measurements of normal
oxidation-reduction potentials (E_0) of the
systems $\text{SeO}_3^{2-}/\text{Se}$ and $\text{TeO}_3^{2-}/\text{Te}$, as a function
of the pH of the medium, conditions were deter-
mined which permit the detection of Se and Te
prosent simultaneously in the solution as H_2SeO_3
and H_2TeO_3 . At pH=0, the rate of the SeO_3^{2-}

Card 1/3

RUMANIA / Analytical Chemistry. Inorganic Analysis.

Abs Jour : Ref Zhur - Khimiya, No 23, 1959, No. 81981

reduction ($E_0=0.76v$) with $SnCl_2$ (Sn^{+4}/Sn^{+2} $E_0=0.3$ volts) is large, and elemental Se separates as a red-orange powder, while TeO_3^{-2} ($E_0=0.305$ volts) is practically not reduced by $SnCl_2$ even when a large excess of $SnCl_2$ is present and the solution is heated. In an alkaline medium (pH 14), the difference between E_0 values for SeO_3^{-2} and TeO_3^{-2} is small (~ 0.1 volts), and both metals are reduced very rapidly with $SnCl_2$ ($E_0=0.85$ volts). In this case, Te and Se separate as black powders; however, Se has a greyish-violet coloration and represents the allotropic form which contains OH^- . Upon drying, Se precipitate regains the red-orange color, while the Te precipitate remains black. For the detection of Se and Te,

Card 2/3

RUMANIA / Analytical Chemistry. Inorganic Analysis.

E

Abs Jour : Ref Zhur - Khimiya, No 23, 1959, No. 81981

one drop of the solution to be analyzed, one drop of SnCl_2 solution in HCl (5 g SnCl_2 is dissolved in 5 ml concentrated HCl + 95 ml water; pH 0.5), and after some time two drops of 2-N. NaOH are placed on the filter paper and dried with warm air, at the same time observing the color of the spot. The detection limit is 5×10^{-6} g of selenite or tellurite. The presence of As^{+3} (also Sb) does not interfere with the detection of Se and Te ; Bi interferes with the reaction in an alkaline medium. For the detection of As in the presence of Se and Te , it is recommended that one use the Tananaev and Panamarev method (after precipitating Se and Te with atomic H).

Institut. :
Title : On the Mechanism of Some Redox Reactions. II.
Titrimetric Determination of Copper and Zinc
without Their Previous Separation.

Orig Pub. : Farmacia (Romin.), 1958, 6, No 1, 37-42

Abstract : Description of a method of determining Cu and Zn in alloys and ores, based on iodometric titration, in a neutral or acetic acid medium, first of Cu^{2+} , and then (after addition of $\text{K}_3\text{Fe}(\text{CN})_6$ and K_2SO_4) of Zn^{2+} , in accordance with the redox reaction: $2\text{K}_3\text{Fe}(\text{CN})_6 + 3\text{ZnSO}_4 + 2\text{KI} \rightleftharpoons \text{I}_2 + 3\text{K}_2\text{SO}_4 + 2\text{Zn}_3\text{K}_2[\text{Fe}(\text{CN})_6]_2$. In the presence of K_2SO_4 solubility of $\text{Zn}_3\text{K}_2[\text{Fe}(\text{CN})_6]_2$ is decreased, the reaction is shifted to the right, and reduction of $\text{K}_3\text{Fe}(\text{CN})_6$ takes place to a complete conversion of Zn^{2+} to the complex compound. The presence in the solution of precipitates of CuI and $\text{Zn}_3\text{K}_2[\text{Fe}(\text{CN})_6]_2$, and also the presence of Pb^{2+} , Sn^{2+} , and Cd^{2+} , produces no substantial effect on the titration; Fe^{3+} interferes. On

 Determination of Divalent and Monovalent Copper
 without Their Previous Separation.
 Orig. Pub. : Farmacia (Romin.), 1958, 6, No 3, 215-220

Abstract : It was found that oxidation of Cu^+ to Cu^{2+} with iodine, in the presence of Cu^{2+} in the solution, takes place quantitatively if Na-citrate (I) is added. The normal oxidation potential (E) of the system Cu^{2+}/Cu^+ , which is 0.167 v, increases in the presence of free Cu^{2+} ions, and becomes equal to 0.689 v, i.e., exceeds the E of the system I_2/I^- (0.543 v); under these conditions the oxidation of Cu^+ with iodine becomes impossible. On addition of I the latter combines with the Cu^{2+} (as they are formed) to a complex and the concentration of Cu^{2+} in the solution does not exceed 10^{-8} ; E of the system Cu^{2+}/Cu^+ becomes equal to 0.341 v and under these conditions Cu^+ is quantitatively oxidized by I.

Abstract : iodine (and thereby the possibility is provided of a iodometric determination of Cu^+ in the presence of Cu^{2+}). The complex compound of Cu^{2+} with I_2 , which is stable at pH 7.0-8.5, is broken down on increase of the acidity and at pH ~ 0 it is possible to determine iodometrically the total amount of Cu (after a determination of Cu^+). On determining Cu^+ and Cu^{2+} , there are added to 25-30 ml 0.1 N solution of iodine, in a tapered bottom flask, consecutively, 5-6 g I_2 , the sample being analyzed (containing $\sim 60-65$ mg of each, Cu^{2+} and Cu^+), and 25-30 ml water. The flask is then stoppered and the contents are agitated gently until all the salts are

Abstract : dissolved. Excess iodine is titrated with 0.1 N $\text{Na}_2\text{S}_2\text{O}_3$ solution to determine the content of Cu^{2+} . Then, 6.0-7.5 ml of 10 N HCl are added to the same solution, the mixture is stirred and the liberated iodine is titrated with 0.1 N solution of $\text{Na}_2\text{S}_2\text{O}_3$ (to determine the total amount of Cu). The content of Cu^{2+} is determined from the difference between the results of the two titrations. Communication II see RZhKhim, 1959, 23003. -- B. Mandic.

by the Cracking of Methane.

Orig Pub : Rev Chin, 8, No 3, 147-154 (1957) (in Romanian with
summaries in German and Russian)

Abstract : Vinyl chloride (I) has been synthesised by the reaction
of HCl with cracked natural gas (containing 10-12%
 C_2H_2) in pilot plant equipment. It has been established
that at a reactor jacket temperature of 170° the conver-
sion of C_2H_2 attains 96-98% when a contact time of 65 sec
is used; this conversion figure is comparable to that
obtained in the synthesis of I from conc. C_2H_2 .

Title : Method of Complex Ester Production at High Temperature Without Catalysts.

Orig Pub: Rev. chim., 1957, 8, No 4, 302-305.

Abstract: Works, in which it has been tried to remove catalysts from various esterification reactions are described. At this occasion, the catalyst action on the reaction rate was replaced with a temperature rise. The investigations, which had been carried out on butyl ester of isonicotinic acid, were extended also over the preparation of plasticizers of the complex ester group, at which it was desirable to obtain a yield near to the calculated one and to eliminate the neutralization phase.

Age Groups Expressed by the Titer of Agglutination Inhibition
Antibodies."

Bucharest, Studii si Cercetari de Inframicrobiologie, Vol 17,
No 4, 66, pp 317-321.

Abstract: In a study of 1,074 sera from persons of various ages,
84.3 percent contained various amounts of antivaccine hemagglu-
tinating antibodies. The curve of average titer versus age shows
4 peaks corresponding to maternal antibodies, first vaccination,
revaccination at 7 years, and revaccination in the armed services.
Small titers of the antibodies persist throughout life, with higher
levels for approximately 3 years following vaccination.

148. INFLUENCE OF DIET WITH REDUCED SALT CONTENTS ON CORTICAL DYNAMICS AND ON THE COURSE OF HYPERTENSION (Russian text) - Trangeizer V. A. Inst. of Nutrit., USSR Acad. of Med. Scis, Moscow - VOIR, PII, 1957, 1672 (15-19)

Studies were made on the influence of hypochlorization on the course of hypertension and cortical dynamics of the patients. Out of 57 hypertensive patients 7 were found to have normal higher nervous function. Marked disturbances in the higher nervous function were discovered in 22 patients; difficulties either in the development of positive or negative conditioned reflexes were observed during rest. These difficulties were generally met with when eliciting conditioned reflexes in patients with hypertension in stage II, and the more so with sound than with light stimulation. In the majority of patients positive and negative conditioned reflexes when initiated remained constant at all stages of observation. Hypochlorization is beneficial in hypertension: the patients' blood pressure is reduced (systolic by 30 to 40 mm. and diastolic by 20 to 30 mm. of mercury on average), the subsequent tendency for the levels obtained being to remain constant with associated diminution or cessation of symptoms. At the same time cortical dynamics approached normal (an improvement in synaptic activity and in the inhibition and adaptability of nervous mechanisms). The general condition of the patients improved. The conditioned reflexes in these patients were maintained during the 2nd and 3rd stages of the investigation. Verbal reports conveyed that there was only a relatively slight change in the reciprocal action of signal systems. References 9. Krymakii - Moscow (S)

Pulverization of slurry and formation of slurry rings in the far end of the kiln. V. L. Frankov. *Tsvetmet* 4, No. 2, 6-11(1936).—The rings are formed as a result of incomplete drying of slurry drops under the influence of hot gases, which make them very sticky. The formation of rings is connected with the peculiar properties of the raw materials used. It can be efficiently eliminated by hanging chains in the farther end of the kiln; their efficiency depends on their distance from the washer, the concn. of the slurry, the no. of chains and the system of hanging.

TITLE: Pharmacology of monoquaternary ammonium salts of 2-(8-dialkylaminoethyl) pyridine

SOURCE: Farmakologiya i toksikologiya, v. 29, no. 4, 1966, 417-420

TOPIC TAGS: pharmacology, pyridine, ammonium compound, cholinoreactive system, ganglionic blocking activity, central nervous system, *AMMONIUM SALT*

ABSTRACT: The results are presented of studies of the pharmacological activity of a series of new compounds — monoquaternary ammonium salts of 2-(8-dialkylaminoethyl) pyridine. Except for compound no. ND-1 which is crystalline, all the compounds are white or light yellow amorphous powders and are easily soluble in water. Toxicity and LD₅₀ were determined in mice. Table one summarizes the experimental results. The mice reacted approximately as follows to lethal or sublethal doses of the compounds: After 3—5 min, breathing quickens, agitation develops, breathing becomes labored, and there is cyanosis of the integument (with compound no. ND-1 the additional symptom of heavy

Card 1/2

ACC NR: AP6027886

salivation). After 10—15 min, movement is difficult, and attacks of chronic or intermittent cramps occur. Compound ND-14 was the most toxic of all the preparations tested. Its quaternary nitrogen atom is joined to a N-methyl piperidine group. Compound ND-12 with three ethyl radicals on the nitrogen is almost as toxic. Decreasing toxicity is found in compounds ND-9 and ND-8, where one or two methyl radicals are substituted for the free valences on the quaternary nitrogen atom. Further weakening of toxic activity occurs when the oxygen-containing morpholine radical is substituted (preparation ND-10). The least toxic compound was no. ND-1 with three methyl radicals on the nitrogen atom. The order of toxicity from most to least is as follows: ND-14>ND-12>ND-9>ND-8>ND-10>ND-1. The compounds affect cholinoreactive structures differently. Internal administration of nos. ND-1 and ND-8 produces a two-step reaction (hypo- and hypertensive). The compounds are in the following order of ganglioblocking effect: ND-12>ND-1>ND-14>ND-9>ND-10>ND-8. The compounds have the following blocking effects on coeliac ganglia: ND-12>ND-1>ND-9>ND-14>ND-10: ND-8 had little or no effect. The greatest capacity for blocking the transmission of impulses along the parasympathetic nodes of the vagus nerve was shown by compound ND-12. The activity of the other compounds is given as follows: ND-12>ND-1>ND-8>ND-14>ND-10>ND-9. The greatest gangliolytic activity was shown by triethyl derivatives.
